Callback Availability V2

7/13/2025

Contents

- Administrator

This block checks if there are any available slots for the customer's preferred callback date and time.

Related documentation:

-

This block checks to see if there are any available time slots for the caller's preferred callback date and time, and provides up to three possible time slots to choose from.

Inputs tab

Specify the desired date and time for the callback.

Example

Results tab

The closest available time slot to the requested callback date and time is returned, while also taking into consideration the Estimated Wait Time (for example, if the current Estimated Wait Time is 30

minutes, the earliest time slot that could be offered is 30 minutes from now). In addition, up to two alternate time slots are also proposed.

> ## Important
>
> The desired day of week, hour, and minute should be collected from the caller in the time zone of the Designer application. For the three closest time slots that are returned, the **Slot *x* Date**, **Slot *x* Day of Week**, and **Slot *x* Time** are all in the time zone of the Designer application, so they can be played as prompts back to the customer to confirm the time, and **Slot *x* UTC** is in the UTC (Coordinated Universal Time) time zone.

You can use this tab to store the time slot results in variables.
