To get started, you need to create an Email dialing profile

When you set up your email profile, you'll see a tab named **Content**. This is where you'll create the email content and specify all associated parameters.

The screenshot shows the 'New Email Dialing Profile "New Email"' configuration page. At the top, there are five tabs: 'General', 'Dialing', 'Treatment', 'Content', and 'Advanced'. The 'Content' tab is selected and circled in red. Below the tabs, a note states: 'All fields marked with an asterisk (*) are required'. The main section is titled 'Email General Template' and includes the subtitle 'General Script with support for Unsubscribe'. There are two dropdown menus: one for '* Type' with 'General' selected, and one for 'Labels' with 'Choose Label' selected.

To begin, specify the following general information:

- Type - Select **General** or **Variable Template**. When you select **Variable Template**, you can create additional email templates by clicking the plus button. The templates can have different sender IDs and reply to email IDs as well as different message content. You can create up to 30 different templates in the UI.
- Labels - If you plan to personalize messages using fields you defined in a labeling schema, select the labeling schema here. Otherwise, the Personalization menu will populate the default CX Contact list fields. See the Personalized Content section below for more information.
- From - Specify the sender's email address.
- Reply to - Specify the email address that accepts responses to the original email.

-
- Subject - The text that appears in the subject line of the email. This text can be personalized.
 - Enable Friendly Options - If you enable friendly options, you can specify easily identifiable names in the **To**, **From**, and **Reply to** fields. The text in these fields can be personalized.

Create a General Email Template

Watch this video to learn how to create a General Email Template.

Create a Variable Email Template

The first template that you create in the system is used as the default template. For subsequent templates, you can add a custom JavaScript expression in the **Selection Expression** field, which evaluates the conditions for a True or False outcome. True allows for that template to be used. If the conditions specified in all such expression fields fail, the default template is used.

Create Message Content

You have two options for creating email content: use the visual editor to create and format all message content or upload an HTML file containing the message content.

Visual Editor

To use the visual editor, set the **Use Visual Editor** switch to the **On** position. The visual editor box appears onscreen, enabling you to create and format text and graphics.

HTML File

To upload an HTML file containing the message content, go to **Browse for HTML -> Select File**. Two new options appear onscreen:

- Preview - Used to view the message content contained in the HTML file.
- Send Test Email - Used to confirm that the email can be successfully delivered and received.

Personalize Message Content

You can personalize message content in the following sections of an email:

- In the subject line
- When using 'friendly' options - the **To**, **From**, and **Reply to** fields
- In the body of an email

The instructions for adding personalized content to a body of a message depend on whether you're using the visual editor to create content or importing an HTML file that contains the content.

Visual Editor

To personalize content when using the visual editor:

1. Select the labeling schema from the Labels menu.
2. From the Personalization menu, drag the contact list field name tag to the body of the message.

Scenario	<p>Action: You write: <i>Hi</i> followed by the <i>First Name</i> tag:</p> <p>Hi First Name x</p> <p>Result: The system scans the contact's information and finds that the <i>First Name</i> value for this contact is John. The customer receives the following email message: <i>Hi John</i></p>
-----------------	---

HTML File

Personalizations in imported HTML

To personalize the content in an imported HTML file, use the following format: tag and attribute value. The value must contain the exact name of the value from the list of allowed send attributes.

Examples:

- Lorem First Name ipsum
- Lorem ipsum
-
-

Add an Unsubscribe Link

To provide customers with the option to unsubscribe from your mailing list:

1. Set the **Enable Unsubscribe** switch to the **On**.
2. Provide the Unsubscribe Confirmation page **URI**.
Once the **Enable Unsubscribe** switch is set to ON, an additional **Unsubscribe page link** personalization becomes available in the personalizations list.
3. Include the **Unsubscribe page link** personalization to your email template. For example, "To unsubscribe follow this link: .

Important

It is the user's responsibility to provide the Unsubscribe page content, hosting and unsubscribe functionality.
