Here are some sample queries for you to understand what information could be searched for in Kibana. The search is specific to the values in the query. It returns the log messages that matches the query.

Query 1: To return podname , namespace , and container name

```
kubernetes.pod_name:"t100-0" AND kubernetes.namespace_name:"voice" AND
kubernetes.container_name.raw:"tenant"
```
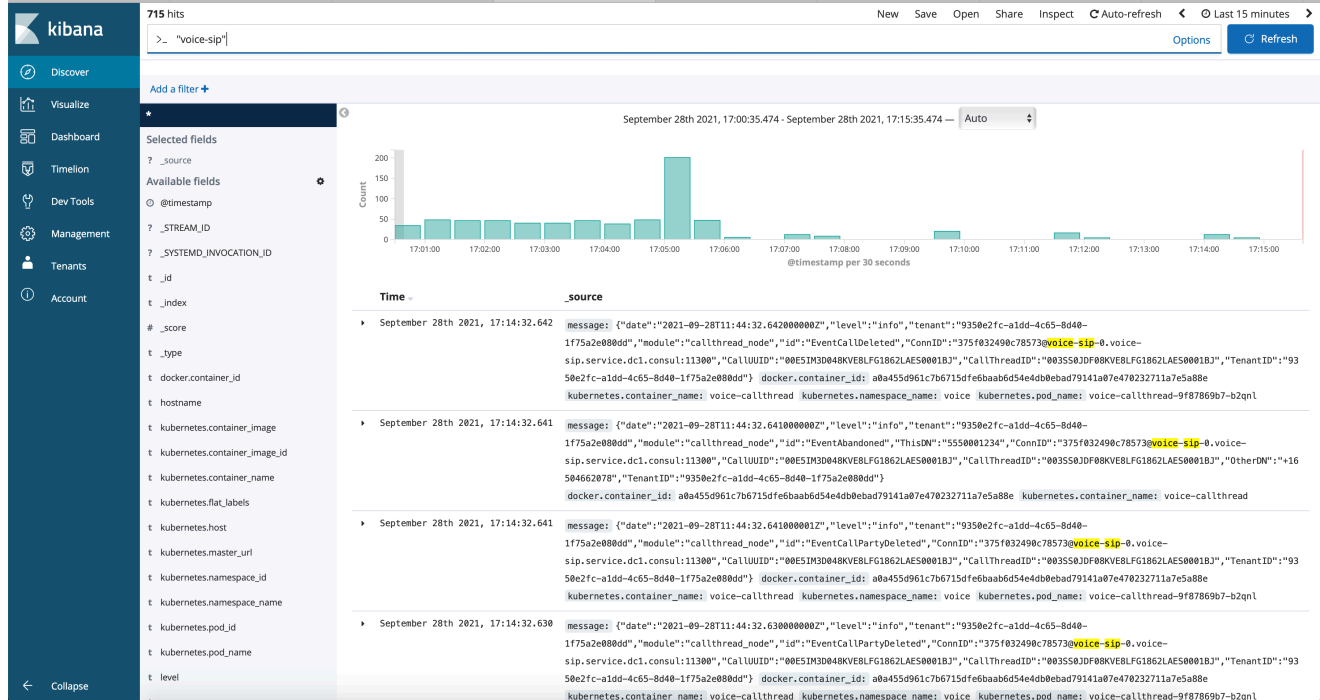

Output:

## Query 2: Any string and logs listed with the string

`"Voice-sip"`

Output

Query 3: Any combination with service, service name, instance , name , version, any value available in the logs

`"service=ixn" AND "servicename=ixn-vqnode"`

Output:

Query 4: CallUUID is consistent across interactions

```
kubernetes.pod_name."voice-sip-0" AND kubernetes.namespace_name."voice" AND
kubernetes.container_name.raw."voice-sip" AND
"CallUUID.00E5IM3D048KVE8LFG1862LAES0001SP"
```

Output:
