For private edition

Some Genesys service containers write logs to log files. This method is similar to that of the structured logging in terms of the the log aggregation. Here, a sidecar to be applied to a sidecar container that is applied to the service. The sidecar container processes this data and sends it to stdout/stderr. Any log aggregator (such as Fluentd) picks up this data and applies the same operations as that of standard structured logs.

Services that can log on to stdout/stderr can be ingested into Elasticsearch by using sidecar container for processing the logs. The service writes the logs to **EmptyDir** and sidecar container collects and processes the output to the /var/log/pods directory.

A log aggregator will scrape directory and post log data to the Elasticsearch index.

What does a sidecar container with a logging agent (like Fluent Bit) require?

You require a ConfigMap that contains the configuration to configure Fluent Bit. For more information on configuring Fluent Bit, refer to Fluent Bit Documentation.

Here is a ConfigMap sample with Fluent Bit version 1.8.x:

```
## FluenbtBit Configmap
apiVersion: v1
kind: ConfigMap
metadata:
  name: fluent-bit-config
  labels:
    k8s-app: fluent-bit
data:
  fluent-bit.conf: |
    [SERVICE]
        Flush
                       1
        Log_Level
                       debug
                       off
        Daemon
        Parsers_File
                      parsers.conf
        HTTP Server
                       0n
        HTTP_Listen
HTTP_Port
                       0.0.0.0
                       2020
```

```
@INCLUDE input-kubernetes.conf
 @INCLUDE output-stdout.conf
input-kubernetes.conf: |
  [INPUT]
      Name
                        kube.*
      Tag
      Path
      Parser
                        docker
                        /var/log/flb_kube.db
     Mem_Buf_Limit
                        5MB
      Skip Long Lines
                        0n
      Refresh_Interval 10
output-stdout.conf: |
  [OUTPUT]
      Name
                      stdout
     Match
```

You also require a pod that has a sidecar container running Fluentd. The pod mounts a volume where Fluentd can pick up its configuration data. Here is an example:

### Services support for Sidecar logging

These services have the option use the Sidecar processed logging approach:

- Genesys Customer Experience Insights GCXI
- Genesys Voice Platform GVP
- · Voice Microservice
- Voice Tenant Service
- Web Based Real-Time Reporting (Pulse)
- WebRTC Media Service
- Gplus WFM
