Universal Contact Service Private Edition Guide

Configure UCS

Contents

- 1 Configure a secret to access JFrog
- 2 Override Helm chart values
- 3 Configure Kubernetes
- 4 Configure security

Learn how to configure Universal Contact Service (UCS).

For private edition

Configure a secret to access JFrog

If you haven't done so already, create a secret for accessing the JFrog registry:

```
kubectl create secret docker-registry --docker-server= --docker-username= --docker-password=
--docker-email=
```

Now map the secret to the default service account:

```
kubectl secrets link default --for=pull
```

Override Helm chart values

Create a file named values.yaml and set the following values depending on your environment.

• Set the number of running PODs:

```
replicaCount: 2
```

• Set the repository for the images:

```
image:
    registry: base address of UCS image in artifactory.
    repository: ucsx/ucsx
    pullPolicy: IfNotPresent
    pullSecrets: if needed, set to the appropriate value for your environment.
```

• Set the ElasticSearch url, for example, http://ucsx-es-client-service.ucsx.svc.cluster.local:9200:

```
elasticsearch:
url: Set URL to the ElasticSearch for data
```

• Set the Authentication service information

```
gauth:
   auth:
    url: URL to Genesys Auth service
   env:
    url: URL to GWS Environment service
```

• Set the memory and CPU limits to the values required for your deployment:

```
resources:
    requests:
    memory: "500Mi"
    cpu: "300m"
    limits:
    memory: "1000Mi"
    cpu: "2000m"
```

• Modify the DNS Configuration to match your environment:

```
dnsConfig:
   options:
        - name: ndots
        value: "3"
```

- UCS requires stickiness for some scenarios (from GWS/WWE). You can enable this on the Service level or create ingress rules to enable and configure them.
- The Ingress configuration requires the sticky sessions. You can enable this on the Service level or create ingress rules to enable and configure them. The cookie name should be set to UCS_SESSIONID.

Configure Kubernetes

Create a Kubernetes ConfigMap named **ucsx-config** and save the database parameters under the following keys:

- CMX_MASTER_DB_HOST the FQDN of the host where PostgresDB server is running
- CMX MASTER DB NAME the database name
- CMX_MASTER_DB_PORT The port number of the PostgresDB server
- CMX_MASTER_DB_USER the database user

Create a Kubernetes Secret named **ucsx-secret** and save the following secrets under the following keys:

- CMX MASTER DB PASSWORD the password for the database user to access the database
- CMX GWS SERVICE CREDENTIALS CLIENT ID the Client ID for GWS Auth
- CMX_GWS_SERVICE_CREDENTIALS_CLIENT_SECRET the Client Secret for GWS Auth

The ConfigMap and Secret can also be created automatically from Helm Chart if the following values are empty:

• existingSecret - to create the Secret

• existingConfig - to create the ConfigMap

The following values will be added to the Secret:

- · db.password
- gauth.auth.clientId
- gauth.auth.clientSecret

The following values will be added to the ConfigMap:

- db.host
- db.name
- db.port
- db.user

Configure security

Universal Contact Service (UCS) requires **clientId** and **clientSecret** registered in the Auth Service. These have to be provided during helmchart deployment.
