RSS:

- [For private edition](#)

Assumptions

- The instructions on this page assume you are deploying the service in a service-specific namespace, named in accordance with the requirements on [Creating namespaces](#). If you are using a single namespace for all private edition services, replace the namespace element in the commands on this page with the name of your single namespace or project.
- Similarly, the configuration and environment setup instructions assume you need to create namespace-specific (in other words, service-specific) secrets. If you are using a single namespace for all private edition services, you might not need to create separate secrets for each service, depending on your credentials management requirements. However, if you do create service-specific secrets in a single namespace, be sure to avoid naming conflicts.

Important

Make sure to review [Before you begin](#) for the full list of prerequisites required to deploy Voice Microservices.

To deploy the Tenant service, see the [Tenant Service Private Edition Guide](#).

For information about deploying Voicemail Service, see [Deploy Voicemail](#).

General deployment prerequisites

Before you deploy the Voice Services, you must deploy the infrastructure services. See [Third-party prerequisites](#) for the list of required infrastructure services.

In addition, see Consul requirements for Voice services and Redis requirements for Voice services for information about specific configuration that must be completed in Consul before you configure or deploy Voice Microservices.

To override values for both the infrastructure services and voice services, see [Override Helm chart values](#).

Deployment order for Voice Microservices

Genesys recommends the following order of deployment for the Voice Microservices:

- Voice Services
- Tenant Service
- Voicemail Service

Create the Voice namespace

Before deploying Voice Services and their dependencies, create a namespace using the following command:

```
kubectl create ns voice
```

In all Voice Services and the configuration files of their dependencies, the namespace is **voice**. If you want a specific, custom namespace, create the namespace (using the preceding command) and remember to change the namespace in files, as required.

Deploy Voice services

Voice Services require a Persistent Volume Claim (PVC); the Voice SIP Cluster Service uses a persistent volume to store traditional SIP Server logs. Before deploying Voice Services, create the PVC.

Storage class and Claim name

The created persistent volume must be configured in the **sip_node_override_values.yaml** file as shown below:

```
# pvc will be created for logs
volumes:
  pvcLog:
    create: true
    claim: sip-log-pvc
    storageClass: voice
    volumeName: (ex sip-log-pv)

  pvcJsonLog:
    create: true
    claim: sip-json-log-pvc
    storageClass: voice
    volumeName: (ex sip-log-pv)
```

Configure the DNS Server for voice-sip

The Voice SIP Cluster Service requires the DNS server to be configured in its **sip_node_override_values.yaml** file. Follow the steps in the Kubernetes documentation to install a **dnsutils** pod. Using the **dnsutils** pod, get the **dnsserver** that's used in the environment.

The default value in the SIP Helm chart is 10.0.0.10. If the **dnsserver** address is different, update it in the **sip_node_override_values.yaml** file as shown below:

```
# update dns server ipaddress
context:
  envs:
    dnsServer: "10.202.0.10"
```

Voice Service Helm chart deployment

Deploy the Voice Services using the provided Helm charts.

```
helm upgrade --install --force --wait --timeout 300s -n voice -f ./voice_helm_values/
agent_override_values.yaml voice-agent /voice-agent-.tgz --set version= --username
"$JFROG_USER" --password "$JFROG_PASSWORD"

helm upgrade --install --force --wait --timeout 300s -n voice -f ./voice_helm_values/
callthread_override_values.yaml voice-callthread /voice-callthread-.tgz --set version= --
username "$JFROG_USER" --password "$JFROG_PASSWORD"

helm upgrade --install --force --wait --timeout 200s -n voice -f ./voice_helm_values/
config_override_values.yaml voice-config /voice-config-.tgz --set version= --username
"$JFROG_USER" --password "$JFROG_PASSWORD"

helm upgrade --install --force --wait --timeout 300s -n voice -f ./voice_helm_values/
dialplan_override_values.yaml voice-dialplan /voice-dialplan-.tgz --set version= --username
"$JFROG_USER" --password "$JFROG_PASSWORD"

helm upgrade --install --force --wait --timeout 200s -n voice -f ./voice_helm_values/
ors_node_override_values.yaml voice-ors /voice-ors-.tgz --set version= --username
"$JFROG_USER" --password "$JFROG_PASSWORD"

helm upgrade --install --force --wait --timeout 300s -n voice -f ./voice_helm_values/
registrar_override_values.yaml voice-registrar /voice-registrar-.tgz --set version= --
username "$JFROG_USER" --password "$JFROG_PASSWORD"

helm upgrade --install --force --wait --timeout 200s -n voice -f ./voice_helm_values/
rq_node_override_values.yaml voice-rq /voice-rq-.tgz --set version= --username "$JFROG_USER"
--password "$JFROG_PASSWORD"

helm upgrade --install --force --wait --timeout 200s -n voice -f ./voice_helm_values/
sip_node_override_values.yaml voice-sip /voice-sip-.tgz --set version= --username
"$JFROG_USER" --password "$JFROG_PASSWORD"

helm upgrade --install --force --wait --timeout 300s -n voice -f ./voice_helm_values/
sipfe_override_values.yaml voice-sipfe /voice-sipfe-.tgz --set version= --username
"$JFROG_USER" --password "$JFROG_PASSWORD"

helm upgrade --install --force --wait --timeout 300s -n voice -f ./voice_helm_values/
sipproxy_override_values.yaml voice-sipproxy /voice-sipproxy-.tgz --set version= --username
"$JFROG_USER" --password "$JFROG_PASSWORD"
```

The following table contains a list of the minimum recommended Helm chart versions that should be used:

| Service name | Helm chart version |
|------------------|-----------------------------|
| voice-config | voice-config-9.0.11.tgz |
| voice-dialplan | voice-dialplan-9.0.08.tgz |
| voice-registrar | voice-registrar-9.0.14.tgz |
| voice-agent | voice-agent-9.0.10.tgz |
| voice-callthread | voice-callthread-9.0.12.tgz |
| voice-sip | voice-sip-9.0.22.tgz |
| voice-sipfe | voice-sipfe-9.0.06.tgz |
| voice-siproxy | voice-siproxy-9.0.09.tgz |
| voice-rq | voice-rq-9.0.08.tgz |
| voice-ors | voice-ors-9.0.08.tgz |

Deploy the Tenant service

The Tenant Service is included with the Voice Microservices, but has its own deployment procedure. To deploy the Tenant Service, see [Deploy the Tenant Service](#).

Validate the deployment

Follow the steps below to validate the successful deployment of voice microservices.

1. Verify the helm deployments using the following command.

```
helm list -n voice
```

Sample output:

| NAME | UPDATED | STATUS | NAMESPACE | REVISION |
|-------------------------|-------------------------------|--------------------|--------------------------------|----------|
| APP VERSION | | | CHART | |
| voice-agent-latest | 2022-08-18 13:22:12.355810905 | +0000 UTC deployed | voice | 4 |
| | 2022-08-18 13:22:12.355810905 | +0000 UTC deployed | voice-agent-100.0.1000006 | 1.0 |
| voice-callthread-latest | 2022-08-18 09:44:07.078583581 | +0000 UTC deployed | voice | 70 |
| | 2022-08-18 09:44:07.078583581 | +0000 UTC deployed | voice-callthread-100.0.1000006 | 1.0 |
| voice-config-latest | 2022-08-19 01:33:02.039668264 | +0000 UTC deployed | voice | 61 |
| | 2022-08-19 01:33:02.039668264 | +0000 UTC deployed | voice-config-100.0.1000006 | 1.0 |
| voice-dialplan-latest | 2022-08-18 12:33:31.223393121 | +0000 UTC deployed | voice | 5 |
| | 2022-08-18 12:33:31.223393121 | +0000 UTC deployed | voice-dialplan-100.0.1000009 | 1.0 |
| voice-ors-latest | | | voice | 1 |

```

2022-08-15 21:40:32.013855856 +0000 UTC deployed voice-
ors-100.0.1000018 1.0
voice-registrar-latest voice 108
2022-08-18 13:41:26.37007884 +0000 UTC deployed voice-

2022-08-18 15:18:47.347509225 +0000 UTC deployed voice-
voicemail-100.0.1000015 1.0

```

2. Verify readiness state of Kubernetes objects using the kubectl commands.

1. Run the following command to check the deployments:

```
kubectl get deployments -n voice
```

Sample output:

| NAME | READY | UP-TO-DATE | AVAILABLE | AGE |
|----------------------|-------|------------|-----------|------|
| voice-agent | 2/2 | 2 | 2 | 40d |
| voice-callthread | 3/3 | 3 | 3 | 704d |
| voice-config | 1/1 | 1 | 1 | 704d |
| voice-dialplan | 1/1 | 1 | 1 | 41d |
| voice-registrar | 1/1 | 1 | 1 | 703d |
| voice-sip-debug-kpan | 2/2 | 2 | 2 | 68d |
| voice-sipfe | 3/3 | 3 | 3 | 727d |
| voice-voicemail | 1/1 | 1 | 1 | 87d |

2. Run the following command to check the Statefulsets:

```
kubectl get statefulset -n voice
```

Sample output:

| NAME | READY | AGE |
|---------------|-------|------|
| voice-ors | 50/50 | 40d |
| voice-rq | 20/20 | 40d |
| voice-sip | 30/30 | 703d |
| voice-siproxy | 5/5 | 40d |

3. Check if all the pods are running and in Ready state.

1. Run the following command to check the readiness of the pods.

```
kubectl get pods -n voice
```

Sample output:

| NAME | READY | STATUS | RESTARTS | AGE |
|------------------------------|-------|---------|----------|-----|
| t2100-0 | 3/3 | Running | 0 | |
| 4d23h | | | | |
| voice-agent-55dc97685b-pnfxr | 2/2 | Running | 0 | |

| | | | | |
|-----------------------------------|-----|---------|---|-----|
| 170m | | | | |
| voice-callthread-75984d848b-bm8q7 | 2/2 | Running | 0 | |
| 170m | | | | |
| voice-callthread-75984d848b-kqv4t | 2/2 | Running | 0 | |
| 170m | | | | |
| voice-config-7666dd56cf-sf69f | 2/2 | Running | 0 | 39h |
| voice-dialplan-788d84d766-8z8d4 | 2/2 | Running | 0 | 37h |
| voice-ors-0 | 2/2 | Running | 0 | 18h |
| voice-ors-1 | 2/2 | Running | 0 | |
| 6d5h | | | | |
| voice-registrar-6c54c6bc9-tkvk2 | 2/2 | Running | 0 | 39h |
| voice-rq-0 | 2/2 | Running | 0 | 38h |
| voice-rq-1 | 2/2 | Running | 0 | |
| 4d17h | | | | |
| voice-sip-0 | 3/3 | Running | 0 | 39h |
| voice-sip-1 | 3/3 | Running | 0 | 11d |
| voice-sipfe-56c7bc77dd-7fpkh | 2/2 | Running | 0 | |
| 170m | | | | |
| voice-siproxy-0 | 2/2 | Running | 0 | 11d |
| voice-voicemail-66f745448b-wqmfc | 2/2 | Running | 0 | |
| 4d20h | | | | |

4. Verify the health status of the pods in Consul dashboard.

If the services are running and in Ready state, the health check will be marked as Green in Consul dashboard.

| Service | Health Checks | Tags |
|----------------------------------|---------------|--|
| voice-agent | 4 | voice-agent-0, voice-agent-1 |
| voice-callthread | 4 | voice-callthread-0, voice-callthread-1 |
| voice-config | 4 | voice-config-0, voice-config-1 |
| voice-config-proxy | 2 | |
| voice-config-proxy-sidecar-proxy | 3 | |
| voice-config-sidecar-proxy | 6 | voice-config-0, voice-config-1 |
| voice-dialplan | 4 | voice-dialplan-0, voice-dialplan-1 |
| voice-dialplan-proxy | 2 | |

5. Check the versions of microservices in Grafana dashboard.

Only if voice-dashboards are deployed in the voice namespace, you can perform this check in the dashboard.

| Service versions | | |
|------------------|------------------------------------|---------------|
| Service | Pod | Version |
| voice-agent | voice-agent-55dc97685b-51852 | 100.0.1000017 |
| voice-agent | voice-agent-55dc97685b-prfrx | 100.0.1000017 |
| voice-callthread | voice-callthread-75984d848b-5px4c | 100.0.1000016 |
| voice-callthread | voice-callthread-75984d848b-brm8q7 | 100.0.1000016 |
| voice-callthread | voice-callthread-75984d848b-kqv4t | 100.0.1000016 |
| voice-config | voice-config-7666dd56cf-sf69f | 100.0.1000014 |
| voice-dialplan | voice-dialplan-788d84d766-8z8d4 | 100.0.1000018 |
| voice-ors | voice-ors-0 | 100.0.1000061 |
| voice-ors | voice-ors-1 | 100.0.1000061 |
| voice-ors | voice-ors-10 | 100.0.1000061 |

6. Check for any crash, KafkaJS or Redis connection errors in Prometheus, Grafana dashboards and/or logs of the respective microservices.

From a functional point of view, you can validate the voice microservices deployment by performing the following steps.

1. Before you can validate the voice microservices, you must create few objects in the Tenant configdb to start the verification.
 1. Port forward the Tenant instance at 8888 port and access the tenant objects through Configuration Manager application.

```
kubectl port forward t2100-0 8888:8888 -n voice
```

2. Create a few Directory Numbers (DNs) under the Sip_Cluster switch with the following options:

```
[TServer]
contact=*
dual-dialog-enabled=false
infra-class=2
make-call-rfc3725-flow=1
refer-enabled=false
sip-cti-control=talk,hold
sip-ring-tone-mode=1
use-contact-as-dn=true
use-register-for-service-state=false
```

3. Create a Place object and map the DNs created.
4. Create new Agents with username and password, under the "Persons" section.
5. Map the Place to the agent.
2. Once the objects are created successfully, follow the steps below to validate the voice microservices deployment.
 1. Register the DNs from Endpoints.
 2. Login/Logout the Agents from Workspace Web Edition or a similar application and change the states - Ready, Not Ready and Logout.
 3. Make few test calls between the agents.

4. Perform other call functionalities like - hold/retrieve, conference, transfer, after call work, and so on.
5. If Designer is available, load different strategies onto route points (external facing SBC Numbers) and validate if the inbound call made from PSTN is being routed to the agent/skill group configured.
3. Additionally, you can also check the below after the deployment of voice microservices.
 1. Verify whether the Grafana dashboards of the voice microservices are updated with relevant data and they reflect the status of the services correctly.
 2. Check if the alerts and alarms are configured for the voice microservices and are active.
